

**ABSTRACT**

Hurricane shutter hardware that are simple, inexpensive, and easy to install on a house. The hardware provide a means of quickly attaching a large covering over a large window or door that can withstand wind, wind-driven missiles, and heavy rain. Brackets are permanently attached to a house near a large window or patio door. The brackets are j-shaped with a bayonet mount. Shutter brackets are attached to a window shutter that can be made of almost any material. The shutter brackets have a j-shape with a t-notch for receiving the bayonet, when mounted to the house bracket. The shutter is locked to the house with simple locks. The brackets carry most of the weight of the shutter, making installation of the shutter quick and easy. When the shutter is rocked into position, it can not move upward, outward, inward, or laterally.
